The accompanying little work deals generally with the subject of artificial fertilization and especially in connection with the Potash (Kali) question. Its object is to make better known in Australasia, the relations of Potash (Kali) to agriculture.

The latest scientific researches in Europe confirmed by practical experiments and positive results, have furnished the material of this compilation.

The men quoted are eminent investigators in science as applied to agriculture, and leaders in the progress of farming in Europe.

Any fertilizing agent, whatever it may be, will only be productive and paying when Potash is added to it, and there is hardly any crop imaginable which could not be benefitted by judicious Potash fertilizing in conjunction with the other substances necessary to plant nutrition.

However, it is not a question of simply using artificial manures but, in order to use them effectually, they must be applied in a correct and proper manner.

Potash (Kali) applied incorrectly or indiscriminately, may prove entirely useless and therefore money thrown away. Potash applied correctly will give the farmer prospects of profits double or treble the outlay.

This book therefore places before the farmer, not only proofs of the pre-eminent importance of the German Potash Salts but it gives plain information and instruction easily comprehensible to everybody how to use them, thus making it a real

Farmer's Guide to Manuring.

It is in the interest of every farmer to take full advantage of the experiences recorded therein and make it his vade-mecum.
