# AGRICULTURE IN SOUTH AUSTRALIA

## The Upper South-East — Counties Cardwell and Buckingham

By P. L. Marrett, District Agricultural Adviser, Keith.

Clearing and rolling scrub in the Keith area.

Reprint from the Journal of Agriculture, S.A.  
(July 1965) 68: 394-406.

SINCE World War II, following the discovery of copper and zinc deficiency in the Upper South-East, agriculture in the district increased in leaps and bounds.

Early development was limited to comparatively small areas near Keith and Bordertown. These areas produced good cereal crops; in fact, wheat crops from the famous Tatiara district near Bordertown have won State Championships. Limited animal production was undertaken as well.

Natural vegetation of this country included associations of pink gum-yacca, mallee-heath and mallee broombush.

Old records indicate that the carrying capacity was in the order of one wether to 30 acres. Burning the natural vegetation was found to temporarily increase stock carrying capacity.

Now, with the aid of copper and zinc, together with better clearing machinery and more suitable pasture species, well-managed properties can carry three sheep an acre. The change is indeed even more remarkable when the heartbreaking efforts of the early pioneers are recalled.

### DUNE FORMATIONS AND DRAINAGE

Dunes and ridges are a feature of the deficient land, and there are two distinct systems. In County Cardwell, ridges, or consolidated dunes, generally lie in a N.N.W.-S.S.E. direction. The Stirling range is the most easterly of these and is considered to be the oldest seashore-line of earlier times. East of the railway line and the Stirling Ranges, deep sand dunes form a complicated pattern.

Sand dunes near Tintinara in County Cardwell.

Excellent subterranean clover pastures have been developed in this district following the discovery that the trace elements, copper and zinc, were required. This has led to big increases in wool production.

Lucerne is the most important pasture on many of the lighter soils in the Upper South-East. Here, the lucerne has been oversown with oats.

The Upper South-East has no natural drainage of great importance. In County Buckingham, some of the surplus surface water is channelled underground by means of naturally occurring sink-holes. In other parts, land-holders make use of drainage bores. Properly managed, these effectively remove the water.

The southern part of County Cardwell lacks good drainage, and surplus water accumulates on low-lying areas. Much of this is removed by evaporation, tending to make some of the country quite saline. Nearer the coast, a small amount of water finds its way to the Coorong—a long, narrow lake stretching many miles along the coastline.

#### WATER QUALITY

Good quality underground water is at a premium in the western division of the Upper South-East. Generally, better water is east of the Stirling range, but on the western side, the water is poorer.

#### ANIMAL PRODUCTION

When large areas are developed and sown to pastures, animal numbers inevitably increase; and in this regard, the Upper South-East has been no exception—both sheep and cattle numbers have risen rapidly.

With cattle, the increase has been mainly in beef breeds. All the breeds common to South Australia are grown in the district—Herefords, Shorthorns, Aberdeen Angus.

The most popular breed of sheep here is the Merino, and the three lines commonly grown in this district are those from South Australia, New South Wales and Tasmania. A tribute can be paid either to the Merino or the district or both, in that all strains of the breed do very well.

Wool cuts are good, usually more than 10 lb. a head. Lambing percentages are also very good. The average exceeds 80 per cent; this is well above the State average.

#### PASTURE SEEDS

A thriving pasture seed industry is developing in the district. Where water supplies are good, irrigation is being used to produce good yields of various pasture seed crops including lucerne, annual medics, phalaris and Currie cocksfoot.

In favourable years, large areas of lucerne and subterranean clover are harvested under dry-land conditions, and returns can be particularly lucrative.

#### PROBLEMS OF THE AREA

The district has three main problems, the most important of which is “water-repellant” sand. A soil fungus prevents quite large portions of the upper part of these sandy soils from becoming wet. Usually, they do become wet by the end of the winter, but it is too late then for growth of the annual species. Thus production from the area can be limited.

Cultivation relieves the problem temporarily, but this is only a partial answer and further research is needed.

Typical country in County Cardwell in which production can be affected by “water-repellant” sand.

The second problem is that of soil salinity. Large tracts of flat land between the ridges in County Cardwell are highly saline, and unwise attempts at development have resulted in failure.

The third problem is that of weeds. Being a comparatively new area, the district as a whole is reasonably free of weeds. However there are signs that they are increasing.

Skeleton weed is prevalent throughout, and although it has not yet reached the "plague" levels of other parts of Australia, constant vigilance is necessary to prevent widespread infestations here.

Salvation Jane is spreading too. The disturbing feature of this weed is that it is beginning to menace lucerne paddocks, and control is difficult in these pastures.

Yellow burr-weed is also becoming a problem, and although an annual, it is

difficult to control and could become a threat to cereal crops.

A large area of country is yet to be developed, and the best means of weed prevention for this land is to sow certified pasture seed.

### NUMBER OF HOLDINGS AND SIZE OF PROPERTIES, 1952-63

#### County Buckingham

The number of holdings has increased by 183. This has been influenced mainly by large scale development carried out by the A.M.P. Society.\* The average size of holdings has decreased from 2,300 acres to 1,600 acres. Holdings in the wheat growing districts are about 600 acres, but properties in the deep sand

\*A commercial organization.

Skeleton weed is prevalent but has not yet reached "plague" levels. Constant vigilance is necessary to prevent new outbreaks and extensions of existing infestations.

A champion wheat crop grown in the Tatiara area by Messrs. A. Obst and R. W. Hunt, Bordertown.

country vary from 4,000 acres to 50,000 acres.

#### County Cardwell.

The number of holdings has increased by 56, due mainly to development by individuals. Average size has decreased from 7,000 acres to 5,000 acres. Holdings average 1,600 acres in the Culburra-Tintinara section, but range up to 20,000 acres west of Tintinara.

### CROP PRODUCTION AND AVERAGE YIELDS

#### Wheat

The area sown to wheat increased substantially during the period 1953-1962. Average yields improved slightly in County Cardwell, while there has been a slight drop in County Buckingham. The extra wheat sown has been on "new" country and has influenced the drop in average yields.

The famous Tatiara area is in County Buckingham. Several State Wheat

Crop Championships have been won by growers in this area.

#### Barley

The total area sown to barley has increased in both Counties. Although there is little difference in the area sown to barley in each County, the proportional differences between cereals are large.

In County Cardwell, barley comprises more than 60 per cent of the area sown to cereals. In County Buckingham, less than 20 per cent is sown to barley. Average yields are variable, and both Counties experience frosts, which on occasions, severely damage barley crops.

#### Oats

Sowings have increased in both Counties, particularly Buckingham. Introduction of the high yielding variety Avon has had a bearing on the increase, and establishment of an oat-growers' pool has also helped.

High-yielding oat crops are characteristic of the district but waterlogging can occur on the heavier poorly-drained soils.

Limestone soil in County Buckingham.

Yields of oats in County Buckingham are particularly good, usually twice those of County Cardwell.

Oats have increased in popularity as a sheep feed supplement, consequently more oats are stored each year. In addition, oats reserved for autumn feed as standing crops are increasing in popularity.

#### Field Peas

Peas are of no great importance in the district and only small areas are grown each year in County Buckingham.

In County Cardwell, pea crops have usually failed and are now rarely sown.

#### Pasture Seed Crops

These crops are of great importance. In the past, lucerne has been of great value to the district and the State, and recently, there has been a trend towards use of irrigation. This has had a marked effect on increasing the average yields of lucerne seed.

Subterranean clover seed, is also harvested, and yields are largely influenced by the spring rains, unless irrigation is used.

Medics and grasses are grown for seed under irrigation, and are very lucrative. As yet, no detailed production figures are available.

### ANIMAL PRODUCTION

#### Beef Cattle

Both Counties have seen increases in beef cattle numbers. In County Buckingham, the increase has been from 2,000 to 18,000, and in County Cardwell, from 600 to 11,000. This can be partly attributed to the tendency to stock "new" pastures with cattle, because they are considered to damage them less than sheep.

#### Dairy Cattle

Dairy types have increased slightly, but this does not match the increase in beef cattle.

However, the opening of the cheese factory at Bordertown has stimulated interest in dairying in County Buckingham. Cheese production for the first 12 months of operation was more than 900,000 lb. This compares favourably with other South-Eastern factories.

#### Pigs

Towards the end of the period under review, there was a rapid increase in pig numbers, County Buckingham has consistently carried 3 times the pig numbers of County Cardwell.

Interest in pig production has no doubt been stimulated by the new dairy factory at Bordertown.

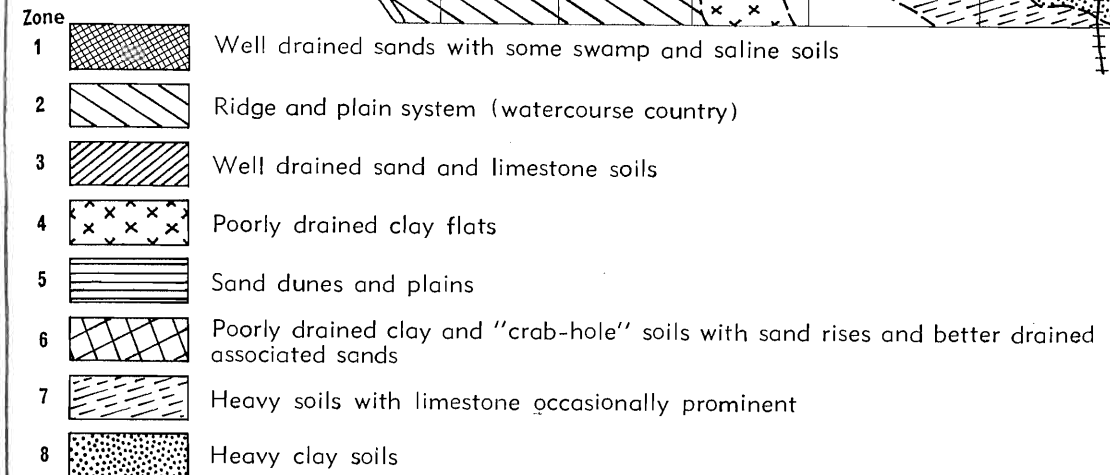

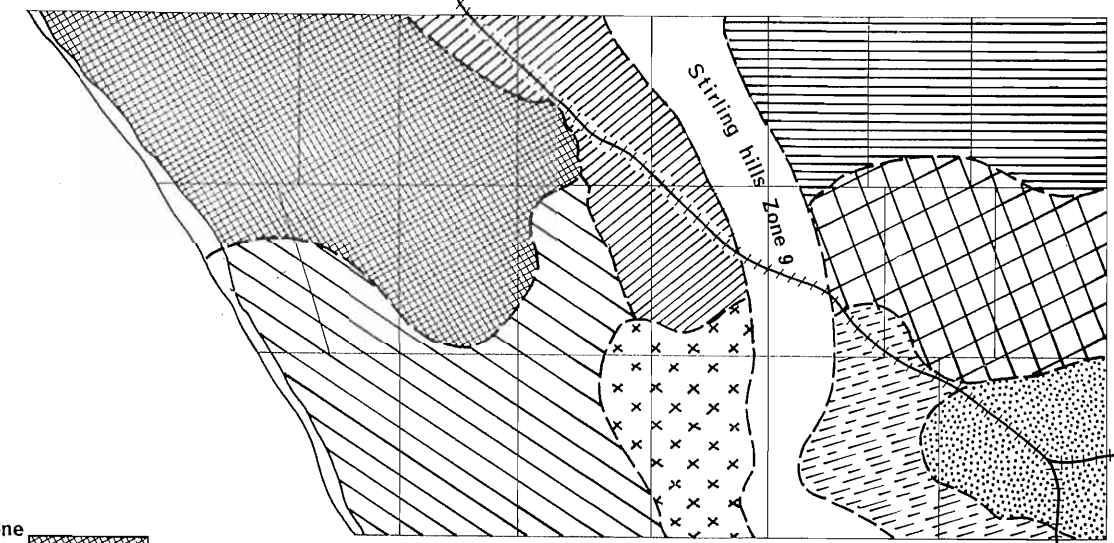

#### Sheep and Wool

Sheep numbers have increased rapidly during the review period. In 1961-62, the number shorn passed the million mark for the first time in the history of the district.

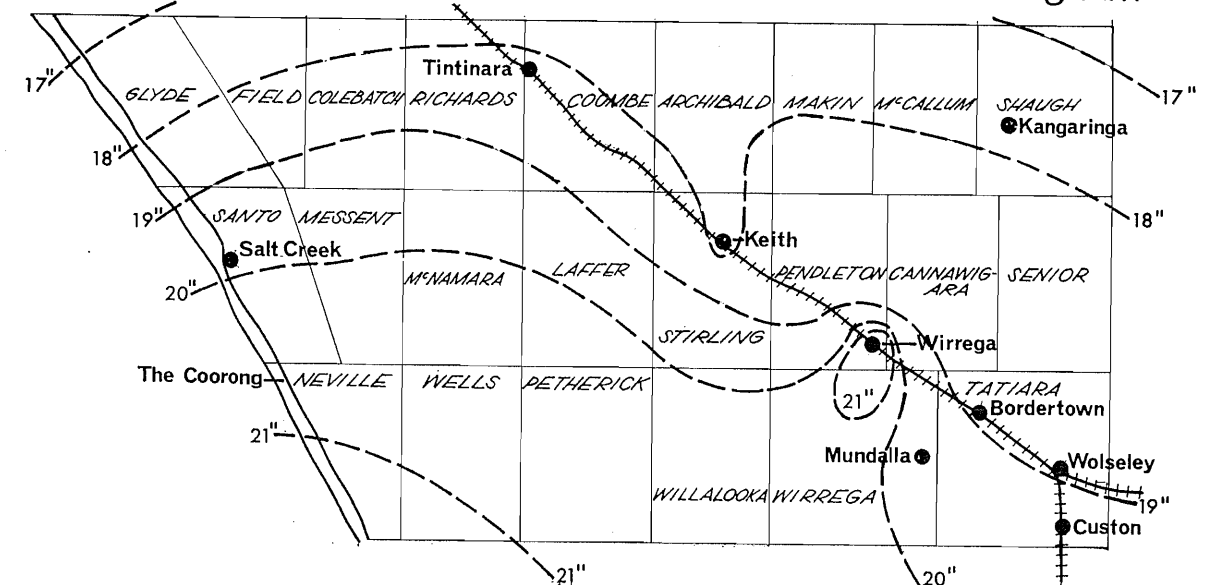

The rate of increase has been slightly higher in County Cardwell than in County Buckingham.

Wool production has kept pace with sheep numbers. Wool is the most valuable product from the two Counties, and in 1961-62 was worth £2.4 million. The average cut is higher than 10 lb. a head in most years.

**Table 1a—GENERAL**

| Zone           | Rainfall                         | Soils   | Water Supplies  | Size of Farms (acres) | Value of Farms                              |
|----------------|----------------------------------|---|---|-----------------------|---|
| 1              | 17in. to 18in.                   | Well drained sandy soils. Small areas of red soil over limestone in the dune ranges. Some swamps and saline areas   | Quantity and quality poor. Up to 1,200 g.p.g.*                                      | 5,000 to 20,000       | £4-£25                                      |
| 2              | 18in. to 22in.                   | Sand dunes and sand plains. Red soils over limestone, grey and black rendzina and saline soils. Occasional peats associated with old water courses. Some swamps | Variable. Good water obtained near dunes at shallow depth. Water on flats is saline | 2,000 to 40,000       | £4-£25                                      |
| 3              | 18in. to 19in.                   | Well drained sandy and limestone soils. Occasional dunes. Some saline flats   | Variable. Usually good water east of highway. Unreliable western side               | 600 to 4,000          | £19-£40                                     |
| 4              | 18in. to 20in.                   | Poorly drained clay flats. Occasional sandy rises. Granite outcrops   | Usually fair to good water  | 800 to 3,000          | £32-£40                                     |
| 5              | 17in. to 18in. (Data unreliable) | Sand dunes dominant. Sand plains and poorly drained flats   | Excellent quality and quantity at depth   | 5,000 to 50,000       | £20-£28                                     |
| 6              | 18in.                            | Poorly drained flats. Some "crab-hole" soils. Sand dunes associated with better drained soils   | Very good   | 1,000 to 5,000        | £28-£38                                     |
| 7              | 18in. to 19in.                   | Heavy soils surrounding crab-hole clay soils. Limestone prominent in western portion  | Usually good supplies quality 50-200 g.p.g.   | 400 to 2,000          | £50-£75                                     |
| 8              | 18in. to 19in.                   | Heavy clay crab-hole soils  | Good  | 400 to 1,000          | £50-£65                                     |
| Stirling Hills | Higher than surrounding plains   | Limestone range with associated sandy soils and red soils over limestone  | Variable. Usually of poor quality   |                       | £10-£40. Depending on state of improvement. |

\* g.p.g. = grains per gallon

**Table 1b—TYPE OF PRODUCTION**

| Zone | Crops | Livestock                            | Pastures  | Fertilizers  | Special Crops                     |
|------|-------|--------------------------------------|---|--|-----------------------------------|
| 1    |       | Beef cattle and sheep                | Lucerne, phalaris, sub-clover, perennial veldt, Currie Cocksfoot, Wimmera Rye grass. Inoculation of legumes (lucerne especially) essential on all soils in Upper South-East | Superphosphate: first year —1 to 2 bags per acre. After 10 cwt. applied: maintenance dressing ½ cwt. Trace elements—copper, zinc |                                   |
| 2    |       | Beef cattle, sheep, limited dairying | As for above, plus strawberry clover, mellilotus, shaftal, perennial Rye grass  | As for above. Lime necessary for sowing new pastures on deep sands inland  | Some strawberry clover harvested. |

**Table 1b—TYPE OF PRODUCTION—continued**

| Zone           | Crops                                 | Livestock                              | Pastures   | Fertilizers  | Special Crops                                    |
|----------------|---------------------------------------|--|--|--|--|
| 3              | Barley, wheat, oats                   | Beef cattle, sheep, dairy cattle       | Lucerne, phalaris, sub-clover, perennial veldt, Wimmera rye, barrel medic, Currie Cocksfoot  | As for above. Lime necessary for new pastures on deep sands  | Lucerne seed, sub-clover seed, annual medic seed |
| 4              | Barley, wheat, oats on suitable soils | Beef cattle, sheep, dairy cattle       | Phalaris, sub-clover, Wimmera rye, strawberry clover. Lucerne on sand rises                  | As for above   | Phalaris seed                                    |
| 5              | Oats                                  | Beef cattle, sheep                     | Lucerne, phalaris, sub-clover, perennial veldt, Wimmera rye                                  | As for above   | Lucerne seed                                     |
| 6              | Wheat, oats, barley, peas             | Beef cattle, sheep, dairy cattle, pigs | Sub-clover, barrel medic, phalaris, Wimmera rye. Lucerne on sand rises                       | As for above   | Lucerne seed                                     |
| 7              | Wheat, oats, barley, peas             | Beef cattle, sheep, dairy cattle, pigs | Lucerne, sub-clover, barrel medic, phalaris, Wimmera rye. Strawberry clover under irrigation | As for above   | Pasture seeds of all types                       |
| 8              | Wheat, oats, barley                   | Beef cattle, sheep, dairy cattle       | Sub-clover, annual medics, Wimmera rye   | 1-1½ cwt. of superphosphate with crop or pasture. Zinc of special importance to crops and pastures | Clover seed occasionally harvested.              |
| Stirling Hills | Wheat, oats                           | Beef and dairy cattle, sheep           | Lucerne, phalaris, sub-clover  | As for Zone 1. Lime necessary on deep sands for new pastures                                       |  |

**Table 1c—PROBLEMS**

| Zone           | Weeds   | Insect Pests  | Seed Crops                                  | Deficiencies  | Special Problems      |
|----------------|---|---|---|---|-----------------------|
| 1              | (1) Horehound (2) Salvation Jane (3) Wild turnip (4) Dock (5) Thistles (6) Onion weed (7) Skeleton weed (8) False caper     | Red-legged earth mite (common to all soils) lucerne flea, cockchafer, pink cutworm, barley grub |   | Cobalt, molybdenum, potash, sulphur are possible deficiencies | Water repellent sands |
| 2              | (1) (2) (3) (4) (5) (6) (8)   | As above  | Coleophora in strawberry clover             | As above  | Salinity              |
| 3              | (1) (2) (3) (4) (5) (6) (7) (9) Yellow burr weed (10) Cape tulip (11) Tomato weed (12) Saffron thistle (13) Soldier thistle | As above  | Heliothis and Etiella in lucerne seed crops |   | As for Zone 1         |

| 5              | (2) (7)   | Red-legged earth mite   | As above                                    | As above  | As for Zone 1         |
| 6              | (1) (2) (3) (4) (5) (6) (7) (9)   | As for Zone 1   | As above                                    | As above  | —                     |
| 7              | (1) (2) (3) (4) (5) (6) (7) (9) (12) (13)   | As for Zone 1   | As above                                    | —   | —                     |
| 8              | (1) (2) (3) (4) (5) (6) (7) (9) (12) (13)   | Red-legged earth mite, lucerne flea, barley grub  | As above                                    | —   | —                     |
| Stirling Hills | (1) (2) (3) (4) (5) (6) (7) (9) (12) (13)   | As for Zone 1   | As above                                    | As for Zone 1   | —                     |

**Table 1d—POTENTIAL FOR INCREASED PRODUCTION**

| Zone | Increased Production   | Alternate Land Use                              |
|------|--|---|
| 1    | Perennial pastures are the key to improved production. Lucerne, phalaris, perennial veldt grass and Currie cocksfoot are the ideal species. Plus autumn pest control measures. Production will go ahead in this area if and when water is reticulated. | There are no alternatives to animal production. |

Table 1d—POTENTIAL FOR INCREASED PRODUCTION—continued

| Zone           | Increased Production   | Alternate Land Use  |
|----------------|--|---|
| 2              | Similar to above except that strawberry clover, melilotus and the rye grasses are of distinct importance for the saline areas<br>Drainage of importance in some areas.   | There are no alternatives to animal production.   |
| 3              | Greater use of lucerne based pastures and sub-division would enable stock numbers to rise. The use of annual medics where applicable and better management of sub-clover pastures would assist in improving crop yields. | Dairying will increase as city populations rise.<br>Pig production will also rise.  |
| 4              | Improved pastures, higher annual fertilizer applications and attention to potash deficiency will lift production.  | There appears to be no alternative production.  |
| 5              | Sub-division and lucerne based pastures are the keys.  | Irrigated seed production for specialized crops in limited areas.<br>Reserving areas for lucerne seed production. Some limited potential for cropping mainly with oats. |
| 6              | Better pastures, heavier fertilizer applications and potash where necessary.<br>Heavier sowings of sub-clover and annual medics in cropping sites will improve both crop and animal production.                          | Limited areas suitable for irrigation of pasture and seed production.   |
| 7              | Better legume pastures, heavier fertilizer applications, the use of gypsum on the "sticky" soils would help the cropping areas.<br>Silage making would improve pastures.   | Pasture seeds production.<br>Dairying can be expected to increase.  |
| 8              | The use of annual medics in this soil type would increase the wheat yields.  | There appears to be no alternative nor any need for alternatives.   |
| Stirling Hills | Sowing of lucerne based pastures. Some limited cropping.   | Very few alternatives.  |

N.B.—All Zones would benefit by better autumn management of pastures.
